

Create a modern futuristic neon arcade game called "Neon Drift" using React, TypeScript, Tailwind CSS, Framer Motion, and shadcn/ui.

The game should feel like a premium browser game with smooth animations, glowing neon visuals, reactive particles, and highly polished UI/UX.

Core Gameplay: The player controls a glowing geometric cube/rect. The cube automatically moves forward continuously from left to right. On every click/tap, the movement direction switches diagonally:

First click → move diagonally upward at 45 degrees Second click → move diagonally downward at -45 degrees Repeated clicking alternates between the two directions.

The objective is to avoid obstacles and survive as long as possible. Difficulty gradually increases over time.

Smooth collision detection and responsive controls are important.

Visual Style: Futuristic neon cyberpunk aesthetic

- Dark background with glowing gradients
- Neon cyan, purple, pink, and electric blue accents.
- Heavy use of glow effects and soft lighting
- Particle trails behind the player.
- Animated background particles/grid
- Smooth visual effects during movement
- Minimalist but premium design
- Geometry Dash + Super Hexagon inspired atmosphere
- Modern arcade feel

UI/UX Requirements:

- Beautiful animated main menu
- Start game screen
- Pause menu
- Game over screen with animated transitions
- Score counter
- High score display
- Smooth loading transitions
- Settings panel UI
- Responsive design for desktop and tablet

- *Modern typography and spacing*
- *Audio toggle UI*
- *Elegant hover animations and microinteractions*

Gameplay Visual Effects: *Player leaves glowing trail particles Collision creates satisfying neon explosion effect*

- *Obstacles have animated glow*
- *Camera shake effect on collision*
- *Dynamic speed feeling through motion effects*
- *Smooth movement interpolation*
- *Pulsing neon effects*

Technical Requirements:

- *Clean scalable folder structure*
- *Organized components, hooks, utilities, and game logic*
- *Centralized theme colors using CSS variables*
- *Modular reusable UI components*
- *Maintainable and readable code*
- *Separate game engine logic cleanly from UI components*
- *Responsive canvas/game area*
- *Animation Expectations:*
- *Framer Motion transitions*
- *Smooth menu animations*
- *Floating neon background effects*
- *Reactive UI animations*
- *Polished game feel throughout*
- *Premium startup animation sequence*

Important: *Prioritize polished game feel, smooth animations, premium neon aesthetics, maintainable frontend architecture, and responsive gameplay experience over adding too many mechanics.*
